

Banking Application: User Administration and Roles

Scenario:

You have recently been hired as a ServiceNow Developer at **Bank**, a financial institution modernizing its legacy operations. Currently, branch managers and tellers use disjointed systems, leading to security risks and data mismatch. To resolve this, you are tasked with building a centralized **Banking Application**. We will start by establishing a secure User Administration foundation to ensure strict role-based access control.

Objective:

Establish the foundation of user access, security roles, and group hierarchy.

Tasks:

1. Create the following Roles:

- x_bank.admin
- x_bank.branch_manager
- x_bank.teller
- x_bank.customer
- x_bank.loan_manager

2. Create Groups:

- Branch Managers
- Tellers
- Customers
- Loan Managers

3. Create Users and Assign Access:

- Create **1 Admin User** (e.g., System BankAdmin).
- Create **at least 3 Users** for all the groups.

Notes:

- **Strict Inheritance Rule:** Do not assign the branch_manager, teller, loan_manager, or customer roles directly to user records. These roles must be assigned to their respective **Groups** only.
- **Admin Exception:** The x_bank.admin role should be assigned **directly** to the specific System BankAdmin user record.
