

Assignment 1 : User Administration and Roles

You have recently joined TechNova Corp, a fast-growing technology solutions provider, as a ServiceNow Developer. The company's internal teams manage numerous cross-functional projects involving developers, QA engineers, architects, and managers. Currently, TechNova lacks a centralized system to oversee project tracking, manage human resource allocation efficiently, or map employees to their technical skillsets. This results in overlapping assignments, overutilization or underutilization of resources, lack of visibility into team capabilities, and communication gaps during project execution. To address these challenges, you have been assigned to design and develop a Scoped Application in ServiceNow, named TechNova Resource Manager. We will start up by setting up User Administration of the application by implementing below objectives.

Objective:

Establish the foundation of user access and group structure.

Tasks:

1. Create the following roles:

- technova.operations
- technova.manager
- technova.developer
- technova.qa
- technova.architect

2. Create groups:

- TechNova Operations
- TechNova Managers
- TechNova Developers
- TechNova QA Team
- TechNova Architects

3. Create users (at least 3 per group) and assign them appropriate roles and group memberships.

4. **Delegation Control for Managers:** A manager can delegate responsibilities or assignments only to another user with the Manager role.

Managers Covered Under This Rule:

- Ramesh Sharma
- Rakesh Verma
- Suresh Patel
- Mahesh Gupta

As **Ramesh Sharma** is on leave, **all his tasks and assignments must be assigned to Rakesh Verma** for the duration of his absence.

Notes:

Ensure that each user is assigned to the correct group and has the corresponding role.
